The elevation of the derrick floor above sea level is **3115** ft.

## DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

This well is presently producing from Tubb/Drinkard perms 5796-5829' & 5972-5993' (Sehl.). The well is producing below its economic limit (2-3 BOPD). It is proposed to squeeze off Tubb/Drinkard perms w/150 sx of cement. Cement will be left inside 7" casing across perms. A completion attempt will then be made in the upper part of the Blinbry zone by perforating 5080-90; 5096-5112'; 5130-46' and 5153-68' (Sehl. Log Mant) w/4 Jets/foot. These perms will then be treated w/2000 gallons of acid and 20,000 gallons of lease crude containing 24,000# of 20/40 sand. Verbal permission for this work received from Mr. E. W. Standley on 3/20/63.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
