DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Well is presently pumping 17 BO and 115 BWPD from Fusselman perforations 6930-75'. Well is a dual Tubb-Driskard-Fusselman. We propose to run chemical cutter and cut off long string of 2-3/8" tubing at approximately 6800'. Run three-tubing bridge plug on dump bailer and set in or just below 7" casing collar at 6906', and dump 12 to 15' of Hydronite on top of bridge plug. Perforate Fusselman at 6827-38 and 6846-57 with two jets per foot, and acidize with 1,000 gallons HCl acid.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
