### DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

On attached packer leakage test, the well indicated communication from the Blinbry Field to the Montoya Field completion. Due to the tension pulled on the #1 string on original completion, we believe that the seal assembly in the Baker Model "D" packer has pulled up the hole and is causing the communication.

We propose checking the #1 string with a tubing plug to define the leak. If the seal assembly is leaking, kill the well with oil and lower the #1 string seal assembly back into the Baker Model "D" packer. Then, swab well back to production and conduct another packer leakage test.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
