

Attachment to U.S.G.S. Form 9-350

Carlson B-25 No. 3

Additional zone to be produced
with subject re-completion 4-82

Prior to re-completion the subject well was a dual completion between the Justis Tubb-Drinkard and the Justis Fusselman.

During the re-completion, the Justis Fusselman was permanently abandoned. The Abo was perforated and is commercial. Consequently we are making application to dual complete between the Wildcat Abo (New Zone) and the Justis Tubb-Drinkard (Old Zone). The only modification to the Justis Tubb-Drinkard pool was that the production tubing has been withdrawn and that we would like to produce Justis Tubb-Drinkard associated gas up the casing/tubing annulus.

Justis Tubb-Drinkard Data is shown below:

Perforations: 5663-5664', 5704-5714', 5731-5742'
5900-5905', 5906-5910', 5920-5930'
and 5936-5942'. (No change in Justis
Tubb-Drinkard perforations during this
workover). All other Tubb-Drinkard
data is same as before workover.
