THEORY OF THE EARTH

CHAPTER I

OF THE ORIGIN OF THE EARTH

THE EARTH, as we see it, is a globe, or sphere, of a very great size, and is composed of a great variety of materials, which are arranged in different layers, or strata, and are called rocks.

The rocks are of three kinds, viz. primary, secondary, and tertiary. The primary rocks are those which were first formed, and are the most ancient of all.

The secondary rocks are those which were formed after the primary rocks, and are of a more recent date. The tertiary rocks are those which were formed after the secondary rocks, and are the most recent of all.

The rocks are also of different colors, and are called by different names, according to their color and composition. The most common rocks are granite, sandstone, and limestone.

The rocks are also of different textures, and are called by different names, according to their texture. The most common textures are crystalline, granular, and stratified.

The rocks are also of different degrees of hardness, and are called by different names, according to their hardness. The most common degrees of hardness are soft, medium, and hard.

The rocks are also of different degrees of durability, and are called by different names, according to their durability. The most common degrees of durability are durable, semi-durable, and non-durable.

The rocks are also of different degrees of fertility, and are called by different names, according to their fertility. The most common degrees of fertility are fertile, semi-fertile, and non-fertile.

The rocks are also of different degrees of beauty, and are called by different names, according to their beauty. The most common degrees of beauty are beautiful, semi-beautiful, and non-beautiful.

The rocks are also of different degrees of utility, and are called by different names, according to their utility. The most common degrees of utility are useful, semi-useful, and non-useful.

The rocks are also of different degrees of rarity, and are called by different names, according to their rarity. The most common degrees of rarity are rare, semi-rare, and non-rare.

The rocks are also of different degrees of value, and are called by different names, according to their value. The most common degrees of value are valuable, semi-valuable, and non-valuable.

The rocks are also of different degrees of importance, and are called by different names, according to their importance. The most common degrees of importance are important, semi-important, and non-important.

The rocks are also of different degrees of interest, and are called by different names, according to their interest. The most common degrees of interest are interesting, semi-interesting, and non-interesting.

The rocks are also of different degrees of curiosity, and are called by different names, according to their curiosity. The most common degrees of curiosity are curious, semi-curious, and non-curious.

The rocks are also of different degrees of mystery, and are called by different names, according to their mystery. The most common degrees of mystery are mysterious, semi-mysterious, and non-mysterious.

The rocks are also of different degrees of wonder, and are called by different names, according to their wonder. The most common degrees of wonder are wonderful, semi-wonderful, and non-wonderful.

The rocks are also of different degrees of admiration, and are called by different names, according to their admiration. The most common degrees of admiration are admirable, semi-admirable, and non-admirable.
