DETAILS OF PLAN OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work.)

This well had been previously perforated and tested from 3055 to 3100' and from 3106' to 3140' and tested all water. After permission was granted to plug these perforations and perforate higher up it was decided to run Packer and set at 3100' and retest, after well had been standing approximately three months, and after swabbing six hours well started flowing 50-bbls fluid per hour with 16% oil, on 14-hour test made 88-bbls oil and 346-bbls water through 9/16" choke with an estimated 400,000 cu ft gas. At time of previous test this oil must have been located between perforations from 3100' to 3106' and wells nearby producing from this same zone has raised oil level up into perforations. With permission we will produce what oil this zone will produce and at a later date will plug all these lower zones according to rules and regulations.
