The elevation of the derrick floor above sea level is _____ ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

We propose to drill this test to a depth of approximately 6500'. We will drill a 17" hole to approximate depth of 200' and cement 13-3/8" 46# casing at total depth with sufficient cement to circulate returns into cellar. We will cement 9-5/8" 36# casing at a depth of approximately 3100' with 1800 sacks. We will cement 7" casing (20# and 23#) at a depth of approximately 6350' with 300 sacks.

We will allow 24 hour cement time on surface casing; 48 hour set time on intermediate casing; and 72 hours on pay string. All cement jobs will be pressure tested as requested in regulations.

We propose to drill with reverse circulation through the open section and drill stem test any indicated layers therein.
I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
